

Play Store — live status

Read this first, before anything else in this folder. It is the record of what is actually done in Play Console, so nobody re-walks finished ground.

■ LIVE — released 26 Aug 2026, 7:59 AM

Turn Someday Into Day One, release 2 (1.0.1), is Available on Google Play. Production track, full rollout, 177 of 177 countries, 20,237 supported devices. Package com.turnsomedayintodayone.app. Developer: Jacques Malone (personal account, ID 4619499919117466586).

Everything in the old "Open" section below is **closed** — closed testing, production access, data safety and the health declaration all cleared and the app shipped. That history is kept at the bottom for reference only. Do not re-walk it.

Open — the whole list, 26 Aug 2026

1. ■ Paste the corrected full description

02-full-description.md, the text between the fences. 3,768 of 4,000 characters. **Play Console** → **Main store listing** → **Full description**.

The live listing may still carry pre-audit wording that oversold the paywall. Jacques believes this is done; nobody has confirmed it in the console. Two minutes to check, and it needs no review and no new bundle.

The first paragraph is not optional. Play rejects updates from non-regulated health apps that bury or drop the "not a medical device" line.

2. ■ Content rating — confirm the user-interaction answers

Policy and programs → **App content** → **Content rating** → **Manage**.

The IARC rating went live 26 Aug (Global Rating ID d0b9a237-57f4-80e0-88d0-3f837bdfd04f). IARC's terms require the answers to account for **all** content in the app, and this app has two things the questionnaire asks about:

- **Rooms** — users post and read each other's writing. "Does the app allow users to interact?" and "Can users share content?" must both be **Yes**. Moderation follow-up: yes — every post is held and AI-checked before it appears, with report and ban paths.
- **Friendly** — an AI, not another user, so it is **not** user-to-user interaction. If there is an AI-generated-content question, answer **yes** for Friendly.

If they are already answered that way: close the tab, nothing to do. If not: fix and resubmit the questionnaire. That is **not** a release. Nothing live is touched and nothing re-enters review.

3. ■ Upload the refreshed screenshots

screenshots-captioned/ — six 1080×1920 panels, rebuilt 26 Aug. **Main store listing** → **Phone screenshots**. Replace all, keep the order.

#	File	Caption
1	01-home.png	Every sober day, counted
2	02-sos.png	One tap when the craving hits
3	03-climb.png	NEW — Ninety steps, at your pace

4	04-lessons.png	A new lesson every day
5	05-journal.png	Write it down, keep it private
6	06-progress.png	Progress that never resets

The Friendly panel was removed on purpose. Friendly is Pro-only now (zero free chats). A store screenshot captioned "An AI companion at 3am" implies it is included, which is exactly the oversell the 24 Aug tier audit went through the entire product to remove. The Climb took the slot: it is free, it is new, and no competitor in the category has anything like it.

Also refreshed: the lesson caption now says "listen in a real voice" (six narrators shipped, including Jacques reading all ninety days), and the journal caption is now the privacy promise rather than a feature description.

4. ■ Buy Pro on a real phone, from the real listing

Never done. Closed testing is not the same billing path as a live Production listing. Install from Play, buy Pro, confirm days 16+ unlock and Friendly opens, then cancel. Better that Jacques finds a broken purchase than a stranger does.

5. ■ Billing Library 8 — nothing to do until Google ships

Console says **fix by Oct 31 2026**. This is the July policy item; the extension was **granted** (it originally said Aug 30). The app shipped to Production with the warning standing, which proves it blocks only future .aab uploads, never a release.

The fix does not exist yet: the shell pulls its billing library from `androidbrowserhelper:billing`, newest published is 1.1.0, and forcing BillingClient 8 crashes at purchase time. Full detail and the exact steps in `HANDOFF.md`. **Do not re-request the extension and do not present this to Jacques as news.**

6. ■ Nothing else

Title, short description, feature graphic, data safety, health declaration, privacy policy, developer verification — all done and live.

Remember the shape of this app

The Android build is a **TWA shell that loads the website**. Everything shipped through Railway (`claude/vibe-code-uwxxlk`) reaches Play users with no new bundle and no review — that is how v5.3, the letter invites and the new web pages all reached users on launch day itself.

A Play upload is only needed for shell-level changes: billing library, icon, package config, target SDK.

Closed history (do not re-walk)

What	When
App created, closed test running	28 Jul
All 10 App content declarations	28 Jul
Screenshots (first captioned set) published	9 Aug
Data safety: Diagnostics unticked, 12 types ticked / 8 counted	9 Aug

Health apps declaration — wellness group, personal account stands	9 Aug
Closed testing complete — 38 testers vs target 15, day 16 of 16	14 Aug
Production access granted	Aug
IARC content rating live	26 Aug
Released to Production	26 Aug, 7:59 AM

App content declarations live under **Monitor and improve** → **Policy and programs** → **App content** → **Actioned tab**, which is not where any documentation says to look.

The "8 data types collected or shared" line is **not** a count of ticks — ephemeral data is not "collected" in Play's sense. Twelve ticked, eight counted. Reading that 8 as a tick count raised a false alarm on 9 Aug; do not repeat it.
