

STUDIO REVIEW & WORKFLOW AUDIT — 18 Aug 2026

Scope: review what Studio has, answer the tool-stack questions (Suno, Manus, fal, CapCut, Gemini), and list what else could automate Jacques's workflow. **Suggestions only — nothing fixed, per his instruction.**

Verification method: features below were checked against the actual UI — the button elements and their click handlers in `Studio/web/index.html` — not just the server routes. This is the corrected version after that pass.

1. What Studio already does

Grouped by job, not menu order:

- **Record:** webcam recorder, teleprompter scripts, free voice recording.
- **Generate (paid, fal — wired):** AI scene images (Flux / GPT-Image / Nano Banana), animate (Kling 2.5 Turbo Pro behind fal's "Standard"), lip-sync, dance, live-portrait, LoRA face-lock training, upscale.
- **Free fill:** Pexels stock search / import / auto-fill of empty shots.
- **Voice & audio:** local TTS (Piper, 5 CC0 voices), voice clone (fal paid + local Chatterbox free), transcribe, audio cleanup, import-song, resound.
- **Edit (free, ffmpeg):** cut, crop, chroma, watermark cleanup, transform, Ken Burns, loop, slow-mo, flip, panels, reframe 9:16.
- **Assemble:** beat-matched Sequencer, captions, audio remaster, thumbnail, render.
- **Post:** Buffer (FB/TikTok/YT) queue, content schedule, auto-shorts.
- **Organize:** assets, characters, locations, relationships, scripts, queue, storage/backup, diagnostics, self-update.

2. His tools, one by one

Tool	Status in Studio	Verdict
fal	Wired (scene, animate, lipsync, dance, liveportrait, LoRA, upscale)	Keep. Already the engine.
CapCut	Replaced (captions, reframe, remaster, assemble, auto-shorts)	Stop paying/using it for daily work.
Suno	NOT integrated. No official API (verified 18 Aug 2026). <code>import - song</code> already takes Suno downloads.	See suggestion #1.
Manus	Not integrated. Trial ends 25 Aug . Image work already covered by fal.	Batch before 25 Aug, then don't renew.
Gemini	Dropped for images (watermark). The "free option" = recovery-app Friendly (already handed off to the other AI).	No Studio role.

3. Suggestions — CORRECTED after clicking through the UI

Three features I earlier flagged as missing already exist (false gaps):

- **Talking-head captions — EXISTS.** Two buttons: "■ Auto-captions (AI listens, ~35¢)" and "■■ Captions from my own voice (free)". Captions burn in at the bottom and are included in renders and shorts automatically. Talking head: paste the lines you actually said, then auto-spread (instant) or tap-to-sync (exact).
- **Batch AI scenes from a script — EXISTS.** The Storyboard has "Generate all remaining scenes" + "■ Queue overnight". (The one-press episode button is deliberately the *stock* path: own pictures → free stock → assemble. AI scenes go through the Storyboard / Director flow.)
- **Auto-schedule posts — EXISTS.** "Send to my Buffer queue" drops into Buffer's next open slot (8am / 12pm / 7pm), and the send flow takes a scheduled time. True hands-free auto-post is limited by TikTok/IG/YT's platform review, not by Studio.

The one real automation gap left:

1. **Suno auto-import.** Suno has **no official API** (verified — Suno is only "exploring" a developer API, Music Business Worldwide Jul 2026). Studio's import - song already takes his Suno downloads, but he has to find and drop the file each time. Suggested: a **"watch my downloads folder"** button so a freshly downloaded Suno song auto-appears in the library. Zero API, zero ToS risk, keeps his paid Suno plan working as-is. (An unofficial Suno API wrapper exists but is reverse-engineered and ToS-risky — not recommended.)

Advice, not a feature:

1. **Manus sunset plan (deadline 25 Aug).** Use the remaining free days to batch-generate episode images 3, 7, 8, 10 — then don't renew; fal + Kling already cover image and animate inside Studio.

4. What I did NOT do

- No code touched in Studio/ or TurnSomeDayIntoOneday/.
- Nothing fixed, nothing pushed.
