

Handover — the search research

For whoever picks up SEO, content or marketing next. Written 15 Aug 2026.

There is one file and it is `KEYWORDS.md` in the repo root

476 lines. Every search number this project owns is in it. Read it before writing a page, a video title, a caption or an ad.

The single most important thing

The Semrush subscription has ended. There is no way to pull a new number.

Everything in `KEYWORDS.md` came from live US-database pulls on **6, 10 and 12 August 2026**, verified against the API before saving, with the two 6 Aug pulls cross-checked against each other on every overlapping term.

That means three rules, and they are not stylistic:

- 1. Quote the numbers in that file. Never re-estimate them.** A volume you reasoned your way to is not data, and it will get written into a plan as if it were.
- 2. A term missing from the file is not proof the term is unclaimed.** It may simply never have been pulled. Say "not measured", never "no competition".
- 3. Do not re-run the research.** You cannot. Do not open a trial, and do not substitute a different tool's numbers into a file whose whole value is that one source produced all of it consistently.

If a decision genuinely needs a number that isn't there, the honest move is to say so and decide without it.

What is in the file

- **The seven tracked keywords** — Position Tracking is capped at seven on the free plan, so these seven are the entire search scoreboard. All difficulty 27 or under, ~1,420 searches a month between them, all in Lane 1.
- **Eight lanes**, each a table of terms tagged **Build** / **Too hard** / **Skip**. The tag already weighs volume, difficulty, intent, and whether the app can honestly answer the query — so the tag beats the volume column every time. A high-volume Skip is still a Skip.
- **A page plan**, in build order.
- **A coverage check** across all 13 habit tracks in the app.
- **Question terms** and a **final pull** (12 Aug), including **Lane 8, "dry drunk"** — ~11,700/mo at difficulty 30–34, and the closest match in the whole dataset to what Jacques actually lived.

The finding that shapes everything

The first tracking run used broad head terms and returned **zero across the board** — samhsa.gov, Wikipedia and drugs.com hold the top of every one of those SERPs. Those results are not hard, they are **closed**: Google fills health queries with institutional sources and a one-person site does not displace a government agency.

Nobody institutional writes for the person who loves an addict. That is why Lane 1 is winnable when the head terms are not, and it is the same audience that outperforms everything else on TikTok and Facebook. If a plan you write drifts back toward head terms like "how to stop drinking", you have re-made the mistake this file exists to record.

How to use it, in one line

Videos: any Build term is a title, said out loud the way the term is written. **Pages:** follow the page plan in order.

What is already built against it

Live pages include /how-to-stop-binge-eating, /codependency-test, /is-my-husband-an-alcoholic, /dry-drunk, /for-her, /when-he-drinks, /partner-drinks, /partner-watches-porn, plus a set of competitor-alternative pages. Check the repo root of TurnSomeDayIntoOneday/ before writing a new page — several lanes are already served.

The nine video episodes in reference/SERIES-2026-08-FOUR-EPISODES.md and reference/SERIES-COUPLES.md are built on these lanes, one habit each.

Related files worth reading, in this order

File	What it is
KEYWORDS.md	The source of search truth. Start here.
reference/marketing-playbook.md	Strategy this research feeds
reference/SERIES-COUPLES.md	The couples episodes and why the series exists
reference/SERIES-2026-08-FOUR-EPISODES.md	The rest of the episode library
reference/backlinks-2026-08-08.md	Backlink research
reference/medical-claims-audit.md	What may not be claimed, anywhere
reference/ADS-AND-CONTENT-MISTAKES-2026-08.md	Things already tried that failed

Read medical-claims-audit.md **before writing a single line of copy.** This is a health-adjacent app. Outcome claims are the fastest route to a rejected store listing and a pulled ad, and no keyword is worth one.
