

Studio — *the complete guide*

Your personal music-video studio: turn a song and a folder of pictures into a finished, platform-ready video — on your own computer, with every price shown before you ever spend a cent.

- Start here
- The 5 tabs
- Characters
- Scenes & prompts
- Motion vs Animate
- Every tool
- Build the video
- Fix problems
- Finish & look
- Shorts
- Campaign
- Money & safety
- Troubleshooting
- The ideal flow

01 Start here — the one thing to know

Studio has two kinds of actions, and telling them apart is 90% of using it well.

Free — everything except generating

Assembling, cutting, transitions, captions, watermark, looks, polish, reframing, shorts, campaign export, backups. Do these as much as you want — they never cost anything.

Costs money — only AI generation

Making *new* AI pictures, video (Animate), voice, lip-sync, and the one-time face-lock training. Every one of these shows its price **on the button** before you tap.

The golden rule

Nothing spends without a click, the price always rounds *up* (so the real bill is never a surprise), and your **Daily spend cap** makes going over impossible. Draft cheap, remake only the keepers on Best.

Turning on AI

The header shows **AI READY** when it's on. If not, open **Settings → Turn on AI** , paste your **fal.ai** key, and it lights up. That key is what the AI actions spend from — it's

your balance, on your account.

02 The 5 tabs (top menu)

Everything lives under one of these five. When you can't find something, it's almost always because you're on the wrong tab.

TAB	WHAT IT'S FOR
 My Media	Your storage bin. Upload clips, pictures & songs here; they become available everywhere. Simple buttons: Add to video, Polish, delete.
AI Scenes	Make new AI pictures from prompts — <i>and</i> the full toolbox (Animate, Sing, Continue, Motion blur, Look, Polish...) lives in the Library grid at the bottom of this tab.
Characters	Your recurring stars (DBC, SBGQ). Add reference photos and train a face-lock so they look the same in every scene.
Sequencer	Where the video gets made : the Producer, Quick Video, the timeline, transitions, undo, Shorts & Campaign.
 Settings	Turn on AI, update the app, storage & backup, spend cap, recover paid clips, diagnostics.

 The tool you want is probably in AI Scenes, not My Media

My Media only has *Add to video / Polish / delete*. The rest of the tools (Animate, Sing, Continue, Crop, Motion blur, Look...) are on your clips in the **AI Scenes** → **Library grid**.

03 Characters & face-locks

A face-lock keeps a character looking like themselves across every scene. It's a one-time training per character.

- 1

Characters tab → create the character (e.g. *DBC, SBGQ*).
- 2

Add **6–20 varied reference photos** of them (different angles, lighting).
- 3

Tap **Train face lock** .  **~\$3.60 once** It takes ~10 min and wires itself into that character automatically.

💡 Likeness truth

Text-to-image *invents* a face, so likeness drifts. The reliable path is **multi-reference** (feed real photos) and **image-to-video** (Animate a real still). For text tattoos like DBC's "DBC" lettering, name them exactly — *"DBC across the chest, DBC down the right forearm, no other tattoos"* — or cover the arms.

04 Making scenes (pictures) & writing prompts

In AI Scenes, describe a shot and generate the still. This is the picture — you animate it later.

A good prompt =

character trigger + what's happening + wardrobe + lighting + a style tail. Lock the character (tap them in the Director's brief, or multi-reference) so the face holds.

Style tail to paste on every prompt:

cinematic music-video still, 9:16 vertical, moody lighting, rich blacks, film grain, ultra-detailed, photoreal, no watermark, no text, no logo, no sparkle.

WHAT	MODEL	PRICE
Scene image	Flux	~\$0.035
Scene with your face-locked character	Flux multi-ref	~\$0.09
Best image	Nano Banana Pro	~\$0.15

💡 Remove a leftover sparkle/watermark

On a picture: Crop → Remove corner mark ✦ → pick the corner → **Patch it out** (keeps the frame) or **Zoom past it** (crops it off). Free.

05 Bringing stills to life — the three movers

Three ways to add movement. Knowing which to use is what makes it look pro *and* cheap.

Motion free

Ken Burns pan/zoom on a still. Your exact picture, gentle camera move, nothing invented. Best for held/atmosphere shots (poster, skyline, throne).

Animate paid

Turns a still into real AI video — she walks, hair moves. Image-to-video, so the face stays locked. Best for movement (walk, run, dance).

► Continue paid

Extends a clip forward: grabs its last frame and animates on from there. Place the two clips back-to-back for one longer continuous shot. **Different from Loop**, which just repeats.

ANIMATE TIER	MODEL	5-SEC CLIP
Draft — best value	Wan 2.5	~\$0.25
Standard — great quality	Kling 2.5 Turbo	~\$0.35
Best — hero shots	Seedance	~\$1.20

💡 **Loop vs Slow-mo vs Continue (all for making a clip longer)**

Loop (free) = repeat, for subtle/ambient shots. **Slow-mo** (free) = doubles length, no jump, for movement. **Continue** (paid) = brand-new forward motion. Never loop a walking/talking shot.

06 Every tool — and where it lives

On each clip in AI Scenes → Library, the buttons are bundled into four labeled groups. Here's the whole map.

GROUP	BUTTONS	COST
🌟 Create	Animate, Sing, ▶ Continue, 👤 Shots, 🔍 QC	paid
🎬 Motion & edit	Motion, Loop, Slow-mo, 🌟 Motion blur, Mirror, Freeze, Crop, Cut, Sound, ● Green screen, 📱 Reframe	free
🌟 Finish	🌟 Polish my video, 🎨 Look, 2× sharper, 🗣️ Clean audio, 🌟 Master for release	free
📦 Use	+ Add to video, Save, ✕ delete	free

🎨 Look themes

On a video → 🎨 Look → one tap grades the whole clip: Dark Luxury, Neon Night, Cinematic, Warm Film, Vibrant, B&W. **Dark Luxury** matches your platinum brand.

07 Building the video (the Sequencer)

This is where a pile of clips becomes a video. Two ways in.

The easy way — Producer

The top card. Pick your song, paste lyrics, set a **budget** (e.g. \$6). It reads the song, casts your clips into scenes, and — when you press **📦 Producer: make it** — builds & renders the whole thing automatically. Nothing charges until you press it.

The hands-on way — Timeline

Tap clips from the **visual thumbnail grid** in your song's order. Tap any clip on the timeline to **watch it**. Reorder with drag or ↑↓. Watch the **seconds total** climb to your song's length.

The controls that save you

- ↶ Undo / ↷ Redo — or Ctrl + Z. Every timeline change is undoable. Experiment freely.
- Save project — names and saves your timeline so it can never be lost.
- Length:** get the seconds total to match your song (a 3:14 song = **194s**). The pre-render check warns if you're over or under.

08 Fixing the two common problems

Jumping between scenes

Set  **Hard cuts** for normal scene changes. For **Continue seams** (a clip extended from another), a hard cut exposes the AI's frame mismatch as a jump — tap  **Smooth Continue seams** to auto-blend just those with a 0.3s crossfade. Then **re-render**.

Still choppy on a fast shot? Add  **Motion blur** to that clip.

Lips don't match the voice

The clip was animated but never synced. Either **cut away** from the mouth during their lines (free, what pros do), or use **Sing** on the clip with the song → pick **Hero** tier → set *vocal from* the second their verse hits, *for* its length.  ~\$0.20

Transitions & edits only change the timeline

The video you already made won't change. You must **Render again** to bake in a fix. The new render is the fixed one.

09 Finishing — making it look & sound pro

- 1 Captions** — paste your lyrics (free) or  auto-captions; pick a style (Bold outline reads best).
- 2 Watermark** — turn on your Synborn logo, position it **top** (the shorts UI covers the bottom).
- 3 Render** — the pre-render check flags anything worth fixing first.
- 4** On the render →  **Look** → **Dark Luxury**, then  **Polish my video** (grade + sharpen + audio master). That's your final master.

10 Shorts & Reels (with templates)

Shorts are cut from your finished video. [Sequencer → Shorts Generator](#).

Tap a 📱 **Quick template** and it sets the length, captions & loop, then builds the short:

- 🎯 **TikTok Hook** (15s) · 📺 **IG Reel** (30s) · ⚡ **Beat-sync** (15s)
- 🎤 **Lyric Drop** · 🔄 **Full Chorus** · 🎬 **Cinematic** (60s) · 🖼️ **Slideshow** · ✂️ **7s Snippet** · 📦 **All 3 sizes**

Then [Render all shorts](#) → [Download all](#).

11 Campaign Export — the "post everywhere" button

One video → a complete posting package. [Sequencer → 📦 Campaign Export](#).

1. Fill in: song title, artist, link, hashtags.
2. Pick your **main video** + the **shorts** to include.
3. Tap [Make thumbnails](#), then **Export**.

You get a **ZIP**: the video & shorts, thumbnails, per-platform captions, your hashtags, and a posting schedule — ready to upload or drop into a scheduler.

12 Money & safety — never overspend again

Four layers keep your balance safe. All in [Settings → Recover paid clips](#) (plus the spend cap).

🛑 Daily spend cap

Set a dollar limit (e.g. \$8/day). Studio flat **refuses** any generation that would go over. Runaway spend becomes impossible.

📖 Spend ledger

A running total of what you've spent, itemized. Failed generations aren't counted (they aren't billed).

Recover paid clips

If a clip you paid for didn't land, tap **Find my finished clips** — it pulls in anything fal already finished. Free.

Auto-save

Every generation is recorded the moment it's sent, so nothing you paid for is ever truly lost — even across restarts.

FULL-SONG COST ESTIMATE (SAVING QUEENS)

~10 Draft clips (\$2.50) + a few Standard (\$1) + 2–3 Seedance heroes (\$3.60) ≈ **\$6–8 for the whole video**. Reusing, cutting, looking, polishing, shorts & campaign are all free.

13 Troubleshooting

PROBLEM	FIX
A new button isn't showing	<code>Settings → ↑ Update my app</code> , then hard-refresh: <code>Ctrl + Shift + R</code> . New buttons never appear until the page reloads fresh.
Sing/Animate "does nothing"	The panel opened but needs a song in your library. Upload your song in My Media first.
Library looks empty	Press <code>F5</code> . If it shows a login screen, sign back in with your <i>same</i> email — your data is tied to your account. Your files live in <code>Settings → Open my media folder</code> and can't be deleted by a refresh.
Video jumps / lips off	See §8 — fix on the timeline, then re-render . The old file stays as-is.
Made a mistake on the timeline	<code>↶ Undo</code> or <code>Ctrl + Z</code> .

14 The ideal flow, start to finish

- 1 Get your **song, clips & stills** into `My Media`.

- 2 Train **face-locks** for DBC & SBGQ (once). Generate any missing stills with the character locked.
- 3 **Animate** the movement shots (Draft/Standard, Seedance for heroes); **Motion** the still ones (free).
- 4 In the **Sequencer**: build the timeline to **194s** →  Hard cuts →  Smooth Continue seams → captions + top watermark.
- 5 **Save project**, then **Render**.
- 6 On the render →  Dark Luxury →  Polish . Final master.
- 7 **Shorts**: tap  TikTok Hook,  Full Chorus,  Beat-sync → render.
- 8 **Campaign Export** → ZIP → post on your schedule.

Set your safety net first

Before you generate anything today, set the **Daily spend cap to \$8** and keep the **spend ledger** open. Then you can work fearlessly.

Studio · Synborn Studios. Everything runs on your own computer and your own fal.ai balance. Prices shown are round-up estimates as configured in the app — your live fal.ai balance is always the final word.
