

STUDIO REVIEW & WORKFLOW AUDIT — 18 Aug 2026

Scope: review what Studio has, answer the tool-stack questions (Suno, Manus, fal, CapCut, Gemini), and list what else could automate Jacques's workflow. **Suggestions only — nothing fixed, per his instruction.**

1. What Studio already does (verified from the live route map this turn)

Grouped by the job it does, not by menu order:

- **Record:** webcam recorder (browser MediaRecorder), teleprompter scripts, voice recording (own voice is free, always).
- **Generate (paid, fal — already wired):** AI scene images (Flux / GPT-Image / Banana), image-to-video animate (Kling 2.5 Turbo Pro behind fal's "Standard"), lip-sync, dance/motion transfer, live-portrait, face-lock LoRA training for recurring characters, upscale.
- **Free fill:** Pexels stock search / import / auto-fill of empty shots (free is tried before paid generation, by design).
- **Voice & audio:** local text-to-speech (Piper, 5 CC0 voices, offline/free), voice clone (fal F5-TTS paid + local Chatterbox free), transcribe (cloud + local), audio cleanup (de-rumble / denoise / normalize), import-song, resound (replace a clip's audio with a stretch of a song).
- **Edit (free, ffmpeg):** cut, crop, chroma, watermark cleanup, transform, Ken Burns, loop, slow-motion, flip, multi-panel, reframe to 9:16.
- **Assemble:** beat-matched Sequencer, captions (Lyrics & Captions for songs + words-on-picture with face-avoid), audio remaster, thumbnail, final render.
- **Post:** Buffer publish (Facebook / TikTok / YouTube), content schedule, auto-shorts (highlight detection).
- **Organize:** assets, characters, locations, relationships, scripts, schedule, generation queue, storage & backup, diagnostics, self-update.

Bottom line: Studio already replaces most of CapCut's daily jobs — the whole "record → caption → reframe → remaster → post" loop is in one place.

2. His tools, one by one

Tool	Status in Studio	Verdict
fal	Wired (scene, animate, lipsync, dance, liveportrait, LoRA, upscale)	Keep. Already the engine.
CapCut	Replaced by Studio (captions, reframe, remaster, assemble, auto-shorts)	Stop paying/using it for daily work.
Suno	NOT integrated. No official API (verified 18 Aug 2026). <code>import t</code> - song already works for files.	See suggestion #1.

Manus	Not integrated. Trial ends 25 Aug . Image work already covered by fal.	Batch before 25 Aug, then don't renew (suggestion #3).
Gemini	Dropped for images (watermark). The "free option" = recovery-app Friendly (already handed off to the other AI).	No Studio role.

3. Suggestions (NOT implemented — Jacques: fix nothing, suggest only)

- 1. **Suno bridge — his explicit ask.** Suno has **no official public API** as of 18 Aug 2026 (Suno is only "exploring" a developer API per Music Business Worldwide, Jul 2026). The clean, zero-risk path that already works today: Suno web → download the WAV/MP3 → Studio **import-song** → beat-matched assembly. The only real "automation" gap is that drop-in step. Options to close it, cheapest first:
 - (a) A **"watch my Suno downloads folder"** button — Studio auto-imports any new song file dropped there. Zero API, zero ToS risk, keeps his paid Suno plan working as-is.
 - (b) An **unofficial Suno API wrapper** (e.g. the `gcui-art/suno-api` project) behind his Suno account. It works today but is reverse-engineered, can break when Suno changes, and may violate Suno's terms — so only worth it if (a) feels like too many clicks. Not recommended first.
- 1. **Talking-head one-press captions.** Studio has `transcribe` (speech-to-text) and caption burning, but the highest-value automation to verify is whether a recorded talking-head gets **styled captions in one press** (`transcribe` → `timed captions` → `burn`). If it currently needs manual timing, that is the one CapCut job people actually miss — worth closing before anything else.
- 1. **Manus sunset plan (deadline 25 Aug).** Use the remaining free days to batch-generate the episode images still owed (episodes 3, 7, 8, 10) — then do **not** renew: `fal` + `Kling` already cover image and animate inside Studio. Don't buy a second image tool that duplicates the one already wired.
- 1. **Batch AI scenes from a pasted script.** The one-press episode button already does `paste-fill` → `stock-fill` → `assemble` for *stock*. If the same one-press doesn't yet do it for *AI scenes* (`paste` a full shot list → `queue` every image + `animate`), extending it would remove the last manual loop in the AI-video path (`queue/scenes` already exists to build on).
- 1. **Auto-schedule the posts.** `schedule` (content calendar) and `buffer/post` (publish) both exist. Suggest wiring them so a scheduled slot that has a finished video auto-posts to Buffer at the set time — that closes the gap between "I made it" and "it went out" without opening Buffer.

4. What I did NOT do

- No code touched in `Studio/` or `TurnSomeDayIntoOneday/`.
 - Nothing fixed, nothing pushed.
- Confidence note:** the "what Studio has" section is verified against the current route map (`Studio/server/studio.js`) and the build log. Suggestions

2 and #4 are flagged to verify against the UI before building — they are

questions, not findings.
